

NEW ENERGY MOVEMENT

What would our world be like if energy were free?

Imagine the possibilities...

Fellow Visionary Friend:

Perhaps you feel it too... that creeping sense that our planet and our lives are on the knife's edge of a most critical juncture. That we are at a crucial crossroads: one choice leading to suffering, destruction and waste; the other to an incredible uplifting of the consciousness and potential of Earth and all its inhabitants. So... which will it be? Perhaps, like us, you find much that despairs and frustrates:

- Worldwide resource grab through military assault. It is a tremendous crime against life and justice. Innocent civilians massacred; their homes and lives shattered. Our own citizens slaughtered, disfigured and scarred by carrying out their orders to attack those whose only crime is inhabiting the land which contains our "strategic interests" or, more to the point, energy supplies that we desperately need to continuing running our present form of society.
- While these atrocities are occurring, the United States continues to consume 28% of the world's energy while having less than 5% of the world's population. Additionally the United States is presently consuming a full 85% of the world's aggregate financial savings to finance its profligate ways.
- From the 2 mile thick "Asian brown cloud" that stretches for thousands of miles to the 42% increase of US asthma rates during the 1990s (currently costing \$11 billion annually), we are literally **choking** on internal combustion.
- According to recent findings, CO2 levels in the atmosphere are higher than they have been in the last 20 million years. In the past 100 years Arctic sea ice has thinned by 40% with global sea levels rising between 10 – 20 cm.

And I am sure you can name many more disturbing facts and figures. However ...

There is a better way.

What might our world look like if new energy technologies were set free?

- Clean, sustainable, and abundant energy - empowering human beings from the most modern of cities to the most remote villages on Earth. A tremendous amount of human energy that is expended merely to find water or firewood would be unleashed; perhaps allowing for the explosion of widespread education around the globe. This dynamic alone could lead to a significant shift in human society as it has been repeatedly shown the hugely positive effects of educational access.
- The deserts could bloom. The ecosystems on our planet can be healed.
- New transportation systems. New possibilities of living.
- Scarcity would be replaced with Abundance. Such simple words but this shift is **MASSIVELY PROFOUND**. It seems that since the dawn of human history the overriding theme has been: there is only so much to go around; *it's either you or me*. Competition. Greed. Warfare (of all kind) and all its horrors is the ultimate manifestation of this dynamic. The best in human nature seems to manifest when one is not filled with fear and feelings of lack. With scarcity we tend to divide and conflict. With abundance we tend to share and cooperate. Life is really just an expression of energy. Imagine if massively abundant energy were to erupt into our lives?

Passionate, concerned, and active groups of citizens can move our world society in a new, rational direction from destructive dysfunction. Perhaps this is why you attended our groundbreaking conference this past October in Portland or have contacted us for more information.

We are humbled and greatly appreciate your interest and desire to get involved.

Do you believe in this new vision for our world? If so, we urgently need your help. The New Energy Movement is at a critical juncture in its history. To thrive as a movement and continue the important educational and organizational work we have set out to achieve, we need as much support as you can offer. No doubt you know how important it is to move to a new energy sustainable future NOW. There is precious little time to waste. We simply do not have that luxury.

The New Energy Movement has a goal to raise \$100,000 in the next 90 days. How much can you help towards reaching that goal? What creative ways can you think of to raise your own personal pledge of support - Auction? Benefit performance? Cleaning out the garage of all that old stuff?

How much is a sustainable future worth? How much is it worth to you to move away from the ruling paradigm of scarcity to a new paradigm of abundance? How much are you willing to give? How much are you willing to strive for?

It is now your turn to act.

We eagerly await your ideas and your intention.
